

LIVE ONLINE WITH CYBERRANGE LABS

AI-Augmented Cybersecurity, Ethical Hacking, SOC and Cloud Security L1 Career Track

A practical 40-day AI-augmented cybersecurity career starter program for serious beginners who want L1 readiness through cyberrange labs, ethical hacking workflow, SOC triage, AWS/Azure/GCP cloud posture checks, GitHub and DevSecOps basics, detection engineering, responsible AI usage, reporting, and a capstone portfolio.

The objective is not to create tool operators. The objective is to build entry-level learners who can investigate, validate, document, explain, automate basic tasks, and use AI responsibly under human supervision.

40 Days

8-WEEK WEEKDAY PLAN

5 / Week

WEEKDAY LIVE SESSIONS

80-90h

GUIDED LIVE HOURS

80%

HANDS-ON PRACTICE

Who Should Join

- Students, freshers, and college learners starting cybersecurity.
- IT support, DevOps, cloud, or system administration beginners moving toward security roles.
- Learners who want to understand how AI changes cybersecurity work without becoming dependent on AI output.

Entry Requirements

- No cybersecurity background required; the course starts from foundation level.
- Basic computer, browser, English reading, and internet usage.
- Laptop with 8 GB RAM minimum; 16 GB recommended.
- Regular attendance and daily practice commitment.

How the Training Works

BRIEFING

Objective and risk context.

DEMO

Trainer-led safe workflow.

LAB

Guided cyberrange practice.

EVIDENCE

Screenshots and notes.

REVIEW

Corrections, Q&A, next action.

Build the base that AI cannot replace: scope, evidence, validation, reporting

Most beginners learn tools. This track builds **security judgment**.

The first half converts interest into working discipline: legal scope, Linux, Windows, networking, recon, vulnerability validation, web/API basics, GitHub security, and evidence-based reporting.

Why enquire now

If a learner wants cybersecurity in 2026, the question is not “which tool first?” It is “can I prove my work, explain risk, and use AI without losing judgment?” This track is designed around that gap.

PHASE 01 / MODULES 1-2

Professional foundation

- Cybersecurity roles, legal scope, lab rules, AI-era career reality.
- Linux commands, permissions, services, logs, hardening and evidence capture.

PHASE 02 / MODULES 3-4

Analyst operating system

- Windows users, Defender, firewall, Event Viewer, Sysmon awareness.
- Ports, protocols, DNS, HTTP, subnetting, traffic flow and packet review.

PHASE 03 / MODULES 5-6

Validate, do not guess

- Approved recon, asset inventory and service inventory inside cyberrange scope.
- Vulnerability validation, severity, business impact and remediation writing.

PHASE 04 / MODULES 7-8

Modern app and code security

- Web/API testing workflow, access control, injection awareness and secure logging.
- GitHub secrets, risky dependencies, container issues and basic pipeline checks.

What the student learns, module by module

Foundation

Security mindset, legal scope, Linux, Windows, and networking.

Practice

Recon, VA, web/API, GitHub, SOC, detection, and cloud labs.

AI-Ready

Responsible AI workflow, LLM security basics, and capstone proof.

MODULE 1

Foundation, Roles and Ethics

Understand risk, legal scope, L1 roles, lab rules, and professional behavior.

MODULE 2

Linux for Security Analysts

Use Linux commands, permissions, services, logs, and basic hardening checks.

MODULE 3

Windows Security Basics

Review users, Defender, firewall, Event Viewer, Sysmon, and PowerShell evidence.

MODULE 4

Networking for Security

Understand ports, protocols, DNS, HTTP, subnetting, traffic flow, and packets.

MODULE 5

Reconnaissance and Enumeration

Build approved asset and service inventories inside cyberrange scope.

MODULE 6

VA and Reporting

Validate lab findings, rate severity, explain impact, and write remediation.

MODULE 7

Web Application and API Security

Practice proxy workflow, access control, injection awareness, APIs, and logging.

MODULE 8

GitHub and DevSecOps Starter

Review secrets, risky dependencies, containers, and basic pipeline checks.

MODULE 9

SIEM and SOC L1 Operations

Triage alerts, inspect logs, write incident tickets, and build evidence notes.

MODULE 10

Detection Engineering Starter

Create SIEM searches, Sigma-style rules, tuning notes, and false positive notes.

MODULE 11

Cloud Security L1

Review AWS, Azure, and GCP posture: IAM, storage, logging, detection, and least privilege.

MODULE 12

Incident Response and Evidence

Build timelines, capture evidence, and write containment and recovery notes.

MODULE 13

AI-Augmented Cybersecurity Ops

Use AI safely for SOC, VAPT, log review, reporting, and validation workflow.

MODULE 14

AI and LLM Security Basics

Understand prompt injection, sensitive data exposure, overreliance, and governance.

MODULE 15

Final Capstone and Portfolio Defense

Present combined SOC, VAPT, cloud, GitHub, AI validation, and reporting proof.

Operate

Use Linux, Windows, networking, SIEM, cloud labs, and evidence workflows.

Investigate

Validate lab findings, inspect logs, review code, and create incident tickets.

Report

Write findings, remediation, executive summaries, AI validation sheets, and capstone readouts.

The 40-day weekday learning journey

1

Foundation and Scope

DAYS 1-5

FOCUS

Cybersecurity roles, legal scope, AI-era reality, lab access, and evidence discipline.

OUTPUT

Readiness proof, ethics checklist, AI safety acknowledgement, and evidence folder.

2

Analyst Operating System

DAYS 6-10

FOCUS

Linux, Windows, networking, ports, DNS, packets, logs, and first SOC ticketing.

OUTPUT

Linux notes, Windows review, network map, packet sheet, and incident ticket.

3

Recon, Enumeration and VA

DAYS 11-15

FOCUS

Approved recon, asset inventory, service enumeration, validation, severity, and reporting.

OUTPUT

Asset sheet, service inventory, risk register, and VA mini report.

4

Web, API and GitHub Security

DAYS 16-20

FOCUS

Proxy workflow, access control, injection awareness, API behavior, secrets, and dependencies.

OUTPUT

Application map, web findings, repository checklist, and API mini report.

5

SOC and Detection

DAYS 21-25

FOCUS

SIEM dashboards, alert triage, Linux/Windows/web logs, detection notes, and tuning.

OUTPUT

SIEM screenshot, SOC worksheet, detection draft, and false-positive notes.

6

AWS, Azure and GCP Posture

DAYS 26-30

FOCUS

IAM, storage exposure, logging, detection services, encryption, budgets, and least privilege.

OUTPUT

Cloud posture checklist, evidence screenshots, and remediation notes.

7

AI Security and Automation

DAYS 31-35

FOCUS

Responsible AI, AI-assisted SOC/VAPT reporting, LLM security basics, and starter scripts.

OUTPUT

AI validation sheet, manual-vs-AI comparison, and automation mini output.

8

IR, Capstone and Portfolio Defense

DAYS 36-40

FOCUS

Incident timeline, containment notes, final SOC/VAPT/cloud/GitHub/AI capstone.

OUTPUT

Final report, portfolio pack, executive readout, and certificate eligibility.

Cyberrange environment, tools, and practice stack

Lab Environment

- Kali Linux, Ubuntu, Windows, vulnerable web apps, API lab, Docker labs, SIEM, IDS/network sensor, GitHub training repository, cloud sandbox, AI practice environment, and reporting pack.

Cloud Path

- AWS, Azure, and GCP security posture coverage for IAM, storage exposure, logging, detection services, encryption, budgets, least privilege, and evidence-based remediation.

AI Safety

- AI is used only with sanitized lab evidence. Manual-first workflow, AI-second support, and human approval are required.

Tools and Platforms

55+TOOLS,
FRAMEWORKS,
PLATFORMS AND
SCRIPTS

Professional open-source, industry-standard platforms, security frameworks, cloud consoles, lab utilities, reporting templates, and self-made scripts used across offensive, defensive, cloud, DevSecOps, AI, and evidence workflows.

Offensive Security

Recon, enumeration, proxy testing, vulnerability validation, web/API testing, and safe lab exploitation workflows.

Defensive Security

SIEM triage, IDS visibility, log review, detection notes, incident tickets, and evidence handling.

Cloud Security

AWS, Azure, and GCP IAM, logging, storage exposure, least privilege, posture review, and detection basics.

DevSecOps + Evidence

GitHub, secrets review, dependency checks, containers, screenshots, reports, and portfolio evidence.

AI + Self-Made Scripts

Approved AI assistants, prompt templates, validation sheets, Bash/Python/PowerShell helpers, and reporting scripts.

Exact tools vary by batch, licensing, lab safety, learner readiness, and cloud sandbox availability.

What Makes It Different

- Daily cyberrange labs instead of only lecture slides.
- Linux, Windows, networking, web, SOC, detection, IR, cloud, GitHub, DevSecOps basics, and AI-assisted operations in one track.
- Report writing and evidence capture from the beginning.
- AI used responsibly as an assistant, not as a replacement for judgment.
- Portfolio-ready deliverables for interview discussion.
- 40 weekday live sessions with 80-90 guided hours, not a rushed weekend workshop.
- AWS, Azure, and GCP posture awareness included at beginner L1 depth.
- 55+ tools, frameworks, platforms, templates, and self-made scripts introduced through labs.
- Manual-first validation habit before AI-assisted reporting or investigation support.
- SOC, VAPT, cloud, DevSecOps, detection, AI, and reporting connected into one workflow.
- Value guarantee: in this fee range, this track is positioned to deliver more practical lab depth, portfolio evidence, and mentor-led structure than typical beginner offerings.

Portfolio outputs, capstone, assessment, and certification

Portfolio Deliverables

- Ethics checklist, AI usage checklist, Linux/Windows notes, network map, incident ticket, asset and service inventory.
- VA report, web findings, repository review checklist, API report, SIEM dashboard, SOC worksheet, detection rule draft and tuning notes.
- Cloud baseline checklist, IR timeline, AI investigation comparison, AI validation sheet, automation output, capstone report and presentation.

Final Capstone

- Combined L1 SOC investigation, mini VAPT review, GitHub security review, cloud posture check, detection note, AI validation sheet, and executive readout.
- AI is used only on sanitized evidence and only after manual investigation.

Updated Assessment Model

AREA	WEIGHT	CRITERIA
Daily lab	30%	Attendance, evidence, workflow, safe scope.
Weekly checkpoint	15%	Understanding, tool usage, risk explanation.
Report quality	20%	Finding, proof, impact, remediation, summary.
Detection + automation	10%	Detection note, tuning notes, automation output.
AI validation	10%	Manual-first workflow, sanitized input, error review.
Capstone	15%	SOC, VAPT, cloud, GitHub, AI validation, presentation.

Certificate Eligibility

- 1 Minimum 75% attendance.
- 2 Minimum 70% lab completion.
- 3 Final capstone submission.
- 4 No lab safety or legal scope violation.
- 5 Required evidence and AI validation sheet submitted.
- 6 Professional behavior during labs and review.

Legal scope, AI safety, and student counselling answer

Legal and Ethical Scope

- All practical work is limited to approved cyberrange machines, owned systems, assigned vulnerable applications, training repositories, controlled cloud accounts, and guided lab evidence.
- Students must not scan, test, attack, access, or interfere with public websites, third-party systems, public IPs, wireless networks, cloud assets, user accounts, or organization assets without written permission and approved scope.
- Not permitted: credential theft, malware deployment, stealth, persistence, evasion, unauthorized wireless testing, or testing outside assigned scope.

AI Safety Rules

- Do not upload confidential, personal, client, organizational, or real security data into public AI tools.
- Use AI only on sanitized lab evidence, approved examples, or controlled model workflows.
- Manual first, AI second, human approval final.
- AI validation sheet is mandatory for AI-assisted report or investigation content.

Is AI Replacing Entry-Level Cybersecurity Jobs?

AI is reducing some basic entry-level work, especially tool-only scanning, simple log summarization, and copy-paste reporting. Cybersecurity is not going away. The stronger opportunity is for students who can use AI responsibly, validate evidence manually, investigate alerts, understand cloud exposure, write clean reports, and explain business impact. This course is designed for that direction. It does not guarantee a job, but it helps students build practical L1 portfolio evidence and AI-ready security workflow.

What This Course Does Not Promise

No job guarantee, no public target hacking, no malware development, no bypassing real-world controls, and no blind dependency on AI output.

Optional Progression

AWS, Azure, or GCP Cloud Security Sprint, VAPT Practitioner Program, DevSecOps and Cloud Security specialization, Detection Engineering, AI Security and LLM Application Security, or mentorship and career lab.

Enquiry notes and next-batch counselling

Recommended Package

- Best market package: full 40-day AI-ready L1 career track.
- Class plan: weekday-only live sessions, 5 sessions per week, delivered across an 8-week learning cycle.
- Guided live hours: approximately 80 to 90 hours with cyberrange labs, cloud posture review, AI validation, automation, and capstone defense.

Final Marketing Promise

Build AI-ready L1 cybersecurity capability through cyberrange practice, ethical hacking workflow, SOC triage, cloud security checks, GitHub and DevSecOps basics, detection engineering, responsible AI usage, professional reporting, and a portfolio-ready capstone.

For fees, batch dates, seat availability, lab access terms, course package details, and counselling before enrollment, connect directly.
